1 ALFA flight logs

ailerons, elevator, rudder (stuck) | engine (off)

Autopilot (Pixhawk) — cmd → / ← meas — Airframe + sensors

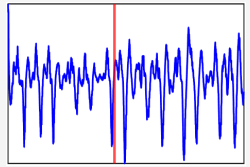

46 real flights, 10 Hz common grid
servo outputs (rc-out) and throttle excluded: they reveal the injected fault

2 Physics-informed features

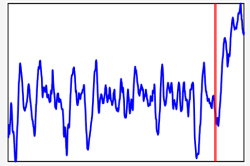

RES r = cmd − meas
roll, pitch, yaw, airspeed, altitude, cross-track, velocity

CMD commanded inputs
roll, pitch, airspeed commands

EFF control effectiveness
gain and correlation: error vs. body rate

roll residual, aileron fault

airspeed residual, engine fault

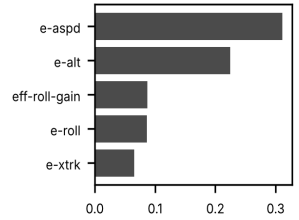

3 s causal windows (0.5 s step)
mean, std, max, slope, last 0.5 s
⇒ 66 features per window

3 Detection, isolation, explanation

Bagged trees (100)
P(class | window)

Alarm: P(fault) ≥ τ
for K windows
Engine | Aileron | Rudder | Elevator

Held-out SHAP audit

compare with a priori fault signatures

top-1 hit, expected mass
⇒ consistent or shortcut

Leave-one-flight-out, nested (τ, K)
detection, isolation, delay, false alarms/h, 95% CI
