1 ALFA flight logs

ailerons, elevator, rudder (stuck) | engine (off)

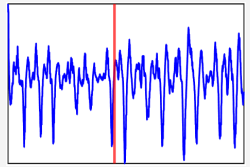

46 real flights, 10 Hz common grid
servo outputs (rc-out) excluded:
they reveal the injected fault

2 Physics-informed features

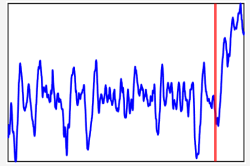

RES r = cmd − meas
roll, pitch, yaw, airspeed, altitude,
cross-track, velocity, throttle

CMD commanded inputs
roll, pitch, airspeed commands

EFF control effectiveness
gain and correlation: error vs. body rate

roll residual, aileron fault

airspeed residual, engine fault

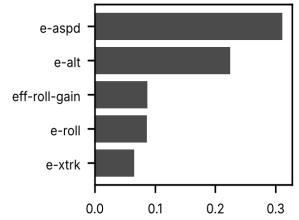

3 s causal windows (0.5 s step)
mean, std, max, slope, last 0.5 s
⇒ 71 features per window

3 Detection, isolation, explanation

Bagged trees (100)
P(class | window)

Alarm: P(fault) ≥ τ
for K windows
Engine | Aileron | Rudder | Elevator

SHAP audit

compare with a priori
fault signatures

top-1 hit, expected mass
⇒ consistent or shortcut

Leave-one-flight-out evaluation
detection rate, isolation, delay, false alarms per hour
